

**Amendments to the Specification are as follows:**

Please amend the paragraph beginning on page 14, line 1 and ending on page 14, line 9 as follows:

A transflector whose thickness was 0.08 mm and whose reflectance was 97.5% was bonded on the lower surface of a light guide plate to form a double-sided illumination plate. The transflector had a wavelength-vs-reflectance property (the average reflectance at a visible light region in the range of 380 to 780 nm; 97.5%) to a standard white plate, as shown in the graph in Fig. 5. After the light source was lit, the luminance was measured at the upper and the lower sides of the light guide plate. At the upper side the luminance was 3,300 cd/m<sup>2</sup>, and 290 cd/m<sup>2</sup> at the lower side. This shows that a part of the light from the light source was emitted to the lower side.
